

MPLS Cloud

The MPLS Cloud service offers the cost benefit of traditional VPNs combined the luxury of advanced features typically seen with expensive enterprise Wide Area Networks.

Connect using almost any technology

We can connect multiple network technologies together to provide you with a seamless, secure network. You may want to connect a head office with branch or retail outlets to your warehouses, almost any configuration is possible.

Given the diversity of communications infrastructure available in Australia, some locations may be able to get fibre whilst others ADSL and others wireless. We can put all of these network technologies together to provide a single secure network.

We can provide the MPLS Cloud service over the following technologies:

- Ethernet (Fibre, EoC/Midband)
- xDSL (ADSL/ADSL2+, SHDSL)
- HSDPA (3G Wireless)

Works with your existing investment

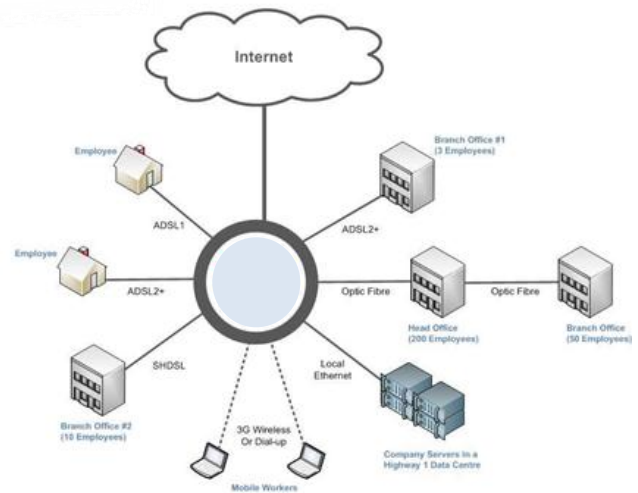

Most organisations already have an existing investment in their network and don't have the luxury of starting again from scratch.

The MPLS Cloud service is both universally compatible and modular enough to integrate into most existing networks.

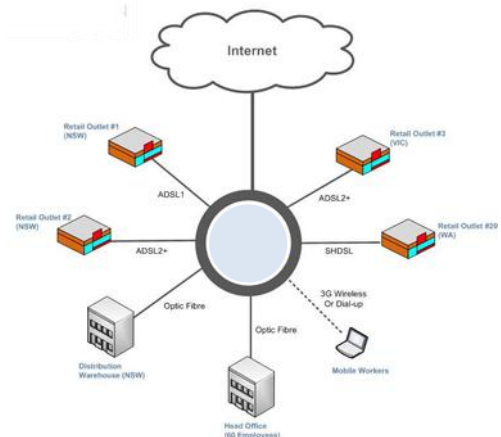

If you have business requirements surrounding security, internet access and content filtering we can offer several configurations to meet these needs including:

- **CentralNet MPLS** - Central Firewalling and Internet Access.
- **DirectNet MPLS** - Distributed Firewalling and Internet Access.
- **PureNet MPLS** – Site to Site Private Access.
